| 13. Other:  | (  |   |  |
|   |  |   |  |
|   |  |   |  |

Continuation of 11. does NOT place the application in condition for allowance because:

In response to applicant's argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which applicant relies (i.e., "determining the optimum gain" is not performed by further changes in amplification of the received wireless signal, but by computing the optimum gain based on the first power level created by amplifying the received wireless signal at the existing gain) are not recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See In re Van Geuns, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993).

The applicant argues that Kopmeiners method does not determine the optimum gain relative to the initial gain value and the first power value. The examiner respectfully disagrees. The examiner repeats his interpretation of the limitation "determining an optimum gain" as being disclosed by Kopmeiners in Column 5, lines 19-24. Also, in the previous action when the examiner used the phrase "relative to the initial gain and power values", the examiner used the plural form of values to indicate both the initial gain value and the first power value.

The applicant also argues that Kopmeiners does not disclose the limitation of "setting the gain to a minimum gain value. In Kopmeiners' system, when the power value is out of the input range, it has two possibilities of either incrementing or decrementing the gain by 20 dB depending on if the power was below or above the input range respectively resulting in two possible gain settings of -20 dB and 20dB. So by decrementing the gain value, Kopmeiners et al. is setting the gain value to -20dB, which is the minimum gain value that is allowed in its system.

Therefore, for the reasons stated above and in the previous office action, all rejections are maintained.
